Accumulator Safety Block
Type : B

Hydraulic Symbol

Specifications

Discharge	: Manual and Electric
Solenoid valve	
Power voltage	: 24VDC / 110 VDC / 220VDC 24VAC / 110 VAC / 220VAC
Power consumption	: 26W
Protection	: IP65 in compliance with DIN 40050 connector in compliance with DIN 43650 type A 2 poles + earthling with AC voltage; internal connector has bridge rectifier
Body material	: Phosphated Carbon Steel Nickle Coated Carbon Steel Stainless Steel
Valve material	: Phosphated Carbon Steel
Seals	: Nitrile / Viton / Butyl / EPDM Low temperature nitrile Hydrogenated nitrile

Technical Data

Nominal flow rates @ 6m/s	: B10= 30 lpm B20=115 lpm B25=180 lpm B32=290 lpm
Shut-off valve	: Ball type
Diameter of inlet port	: 10, 20, 25, 32 mm
Relief valve Port Dia	: 10 mm
Set pressure	: 5 to 420 bar.
Max. Pressure (PS)	: 420 Bar.
Test Pressure (PT)	: 1.43 x PS
Temperature range	: -40°C to +150°C (+65°C with solenoid valve).
Fluid Viscosity range	: 10 to 400 cSt
Recommended viscosity	: 32 cSt
Fluid contamination degree	: Class 21/19/16 according to ISO 4406:1999
Electric type	: 24 VDC NO as standard 24/110/220 | VAC NO/NC 24/110/220 | VDC NO/NC

Description

The Safety Block is one compact unit comprising of all the components required for easy assembly and dismantling the accumulator during servicing.

A relief valve is installed for safety of the pressure line. It is recommended to use a safety block per accumulator. The principle of operation (shut-off) is based on a working principle of that of the ball valve. Each safety block is provided with a port for the pressure line coming from the pump, a port to connect the accumulator, a port for the drain and a port to connect a pressure gauge or for remotely monitoring the pressure.

These safety blocks should not be used as flow control valves by placing the handle in the intermittent position and shall be used only in the extreme position (fully open or fully shut).

It is desirable to mount the safety block as close as possible to the accumulator.

Our safety blocks are installed with manual discharge lever which connects the accumulator to the tank. On request we can install electrically operated discharge valves.

Pressure relief valve: The advantage of installing safety block is that the pressure relief valve is inserted in the block and protects the pressure vessel during over pressure. The cartridge pressure relief valve opens the pressure port to the tank port during over pressure. The European Directive recommends installation of pressure relief valves in the hydraulic systems. CE mark is possible for the relief valve.

Technical specifications subject to change.

SEALS-TEMPERATURE-LIQUID COMPATIBILITY

The choice of the elastomer used for the seals depends on the liquid to be used and on the operating temperatures (and at times, storage). In the chart below, each polymer has a designated letter to be used in the ordering code.

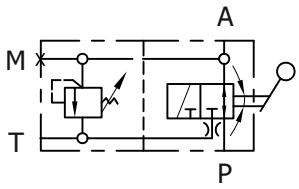

Code letter	Polymer	ISO	Temperature range (°C)	Some of the liquids compatible with the polymer
P	Nitrile (Buna-N / Perbunan)	NBR	-20 to +80	Mineral, vegetable, silicon and lubricating oils, industrial water, glycols, non-flammable liquids (HFA-HFB-HFC), aliphatic hydrocarbons, butane, diesel oil, kerosene, fuel oils etc.
F	Low temperature nitrile	NBR	-40 to +70	Same as with standard nitrile + a number of different types of Freon. (This contains less acrylonitrile than standard and is more suitable for low temperatures, but its chemical resistance is slightly lower).
K	Hydrogenated nitrile	HNBR	-30 to +130	The same as with standard nitrile but with excellent performance at high and low temperatures.
E	EPDM (Ethylene-Propylene)	EPDM	-30 to +100	Glycol-based brake fluids, Hot water, leaching fluids, detergents, water-glycol (HFC), many acids and bases, saline solutions, skydrol 7000 etc.
B	Butyl	IIR	-20 to +90	Phosphoric esters (HFD-R), phosphate esters, fyrquel, hot water, ammonia, caustic soda, some kinds of Freon (22-31-502), Glycol-based brake fluids, ketones, esters.
V	Viton (Flouroelastomer)	FKM	-10 to +130	Mineral oils, greases, non-flammable fluids of HFD group, silicone oils, animal and vegetable oils, aliphatic hydrocarbons (gasoline, butane, propane, natural gas), aromatics hydrocarbons (benzene, toluene), chlorinated hydrocarbons (Tetrachloroethylene, carbon tetrachloride), fuels (regular, super and containing methanol), excellent resistance to ozone, weathering and ageing.
