High Pressure Filter

Inline mounting

Type : 250/450-LE/LEN

Technical Data

Design	: Simplex Inline
Max. Pressure (PS)	: 250 bar [3625 psi] 450 bar [6525 psi].
Test Pressure (PT)	: 1.43 x PS (as per CE/PED) 1.3 x PS (as per ASME)
Temperature range	: -20°C to +100°C (Standard) -4°F to +212°F (Standard)
Connection	: Upto SAE 2-1/2" / SAE-32
Element design	: LE Series - EPE standard LEN Series - As per DIN-24550

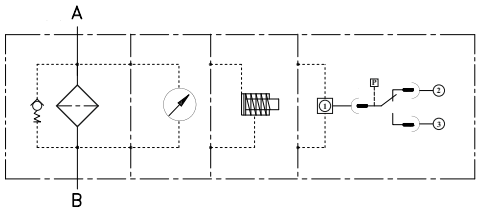

Material of Construction

Head	: GGG50.
Bowl	: Carbon Steel.
Seals	: Nitrile/Viton/EPDM/Neoprene/Butyl.
Paint	: Bowl Externally painted in RAL-5010. Others on request.

Flow Capacity

0005 / 0040	50 lpm [13 gpm]
0008 / 0063	80 lpm [20 gpm]
0013 / 0100	130 lpm [35 gpm]
0015	150 lpm [40 gpm]
0018	180 lpm [45 gpm]
0020 / 0160	200 lpm [50 gpm]
0030 / 0250	300 lpm [65 gpm]
0045 / 0400	450 lpm [100 gpm]
0095 / 0630	950 lpm [250 gpm]
0145 / 1000	1450 lpm [380 gpm]

Hydraulic Symbol

Description

The 250/450-LE/LEN series Filters are used for direct installation in the pipeline and provide wear protection of downstream components & systems. Simplex in design for inline mounting the filter inlet & outlet are located the opposite sides. The flow path arrow (inlet to outlet) is marked on filter head.

The Filter head is provided with an element locating spigot. The Filter bowl is mounted below the filter head and is unscrewed for maintenance.

Accessories

Maintenance indicator - for monitoring the filter element contamination status. Available in various designs including

- Optical (pop-up version) with Electrical option.
- Optical (dual dial version) with Electrical option.
- Optical-Electrical with 2 switching points.

Magnet - to protect the filter from ferrous contamination.
Bypass valve - to protect the filter element during start-up and over pressurisation due to clogging.
Drain valve - for draining the filter during servicing.

Filter Element

The Filter Element is of star-pleated design with optimised pleat density for providing prolonged life.

The filter element is of Out-to-In design and the contaminant is retained outside the filter element and collected in the filter bowl.

The elements are available in various media options and selected based on the required oil cleanliness, initial pressure drop and dirt holding capabilities.

Media options for the filter element include
SS Wire Mesh - Cleanable, Nominal filtration.
Paper - Non-cleanable, Nominal filtration.
Non-woven - Non-cleanable, Nominal filtration.
Inorganic glass fibre - Non-cleanable, Absolute filtration acc. to ISO-16889.
Aquasorb - Water absorbing media, Non-cleanable.

For special applications / fluids the filter elements are supplied with SS hardware (end caps & inner tube) and / or different adhesives.

Technical specifications subject to change.

Maintenance Indicator functioning

These indicators work on the differential pressure and operate when a preset pressure differential is reached between the inlet & outlet ports.
In the pop-up version a red indicator pin pops out in the housing chamber thereby indicating the state whereas in the dual dial version two dial gauges - with green, yellow & red bands - placed on opposite side indicate the condition. If available, the electronic switching element is also triggered.
In the 2-switching points version (type T) the green LED glows in operating condition, yellow LED glows when 75% of the preset pressure differential is reached and red LED at 100%.

T = Optical/Electrical with 3 LEDs & 2 Switching points

xx - Cracking pressure (bar)

Installation

Before installation, conduct a visual check to ensure that the filter has not suffered any damage during shipping / handling. Verify that the requested type matches with what stamped on the nameplate.
Verify operating pressure with name plate information.
During assembly of the filter the tightening torques (refer page 4), the flow direction (direction arrows on the filter head) and the required service height (A3 in fig.1) of the filter element are to be taken into consideration.
Mount the filter assembly using the mounting holes on the filter head (C3) considering the flow direction. Failure to observe flow direction during assembly with cause damage to the filter element and components downstream.
Tighten the mounting bolts to specified torques (page 4).
We recommend using a suitable safety relief valve in the system to ensure the user and equipment are protected against possible damage caused by pressure surges.
Provide for the required servicing clearance below the filter for cleaning / replacing the filter element.
These filters must preferably be installed in vertical position with the filter bowl at the bottom to ensure proper venting and draining.
Proceed to the assembly ensuring the filter is not subjected to any abnormal forces and also fastened to avoid the transmission of vibrations. Tighten the inlet and outlet connections to the specified torques.
Make sure the optical part of the indicator is visible and the electricals connected appropriately.
If the maintenance indicator is ignored the bypass valve, if available, will open when the pressure differential increases thereby bypassing the filter element and contaminated fluid will pass to the clean side of the filter outlet thereby compromising the filtration effectiveness and risking the downstream components.

Connecting electrical indicator

Connect indicator using the three wired cable.

Verify electrical ratings on the indicator (6) name plate.

Connection settings:

1. Closer	1 (black) + 3 (blue)
2. Opener	1 (black) + 2 (brown)
3. Changer	1 (black) + 2 (brown) + 3 (blue)

Special Instructions

It is strictly forbidden to:
- weld or solder or carry out any mechanical operations on the filter.
- engrave or permanently stamp the surfaces of the filter and / or carry out other operations that could affect or change the mechanical properties of the filter.
- use the filter as a structural element: it should not be subjected to stresses or loads.
- change the data of the nameplate and / or filter without the permission of the manufacturer.
- use a different fluid than those designed for.

Starting Operation

Switch on the service pump.
Ensure the filter is completely filled with the working fluid and air in the housing vented.

Maintenance

The filter element is clogged and must be changed or cleaned when at operating temperature the red pointer on the pop-up indicator (8) is hard against the plastic cap / the pointer on the dual dial indicator (8) is at the end of the red marking and / or the switching process on the electrical indicator is triggered.

Filter element service

Switch off pump. Drain the filter housing through the drain plug (10) / drain valve. Unscrew filter bowl (2) and remove filter element (3), turning slightly off from its locator in the filter head (1). Check filter bowl inside and clean if necessary.
Filter element of type H..-XL, H..-XP, H..-XE, H..-XC, AS..., P... and VS ... is to be replaced.
Filter elements with G... & M... media are cleanable. The effectiveness of cleaning depends on the type of dirt and the level of the differential pressure at the time of changing the filter element. If the differential pressure after the filter element's cleaning process exceeds more than 50% of the pre-service value the G... & M... filter element also needs to be replaced.
Remove the safety packing from the new filter element before installing in the filter.
Replace filter element by slightly turning it back on its locator. Check Housing O-Ring (4) and Support Ring (5) on filter bowl (2), replace in case of damage or wear. Screw filter bowl and tighten to the specified torque (page 4) at hexagon bolt using a suitable tool.
Operate filter as described above.

Pressure Directives

Pressure Line Filters for hydraulic application are pressure holding equipment according to Article 2 Section 5 of the Pressure Equipment Directive 2014/68/EU. However, on the basis of the exception in Article 1, Section 2(f) of the PED the pressure line filters are exempt from the PED if they are not classified higher than category I (Guideline A-19) & do not receive any CE mark.

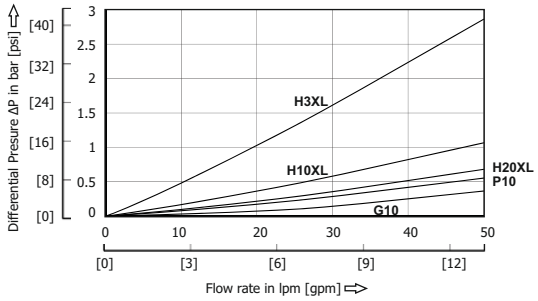

Disposal / Environmental Protection

Careless disposal of the filter, filter element and the residual fluid contained therein can cause environmental pollution.
Dispose the filter / filter element in accordance with provisions applicable in the country of use.
Fluid residues are to be disposed according to the respective safety data sheets valid for the specific hydraulic fluids.

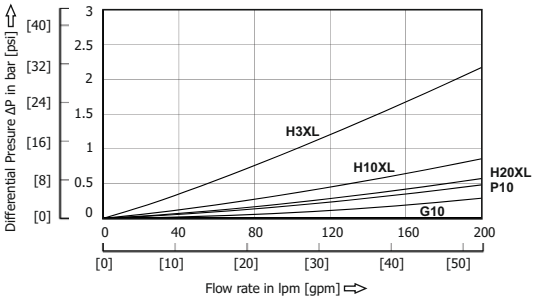

Performance Curves (Flow rate Vs Pressure Drop) - for complete filters

Oil Viscosity : 30 mm2/s [142 SUS]
Specific gravity < 0.9 kg/dm3
Recommended initial Pressure Drop (ΔP) for assembly = 1.5 bar [21.7 psid]
